VOLUME I

TABLE OF CONTENTS

Introduction

1.0 Development Monitoring Programs

1.1 Tract Photography

1.2 Hydrology and Water Quality

1.2.1 Levels and Flows

- 1.2.1.1 Surface Streams
- 1.2.1.2 Springs and Seeps
- 1.2.1.3 Alluvial Wells
- 1.2.1.4 Bedrock Wells
- 1.2.1.5 Impoundments/Land Applications/
Reinjection/Discharge
- 1.2.1.6 Shaft and Mine Water
- 1.2.1.7 Shale Dumps
- 1.2.1.8 Supplemental Water Data - Hydrology

1.2.2 Water Quality

- 1.2.2.1 Surface Streams
- 1.2.2.2 Springs and Seeps
- 1.2.2.3 Alluvial Wells
- 1.2.2.4 Bedrock Wells
- 1.2.2.5 Impoundments/Land Applications/
Reinjection/Discharge
- 1.2.2.6 Shaft and Mine Water
- 1.2.2.7 Sediments

1.2.3 Water Quality Assurance

1.2.4 Special Reports

INTRODUCTION

Regular environmental reporting for Oil Shale Tract C-b during the interim monitoring period consists of two six-month data reports submitted February 15 and July 15 for 1983. Limited data analyses were included in the February report.

The Interim Monitoring Program was initiated in March 1982. The data reported here fulfill the environmental monitoring requirements specified for the interim monitoring period by the DMM-OS. Data are reported for the period of January 1983 to May 1983. Data stored in the computerized data base and summary tables presented in this report are correct to the best of our knowledge. Any errors found in previously reported data appear in the Data Corrections section.

Data not previously reported for dates prior to this report period are presented in the Supplemental Data Sections for meteorology, air quality, hydrology and lab analyses.

1.0 Environmental Monitoring Program

The Development Monitoring Program was discontinued in March 1982 and replaced with an Interim Monitoring Program during a period of reduced site activity at the C-b Tract. Each section will specify changes made to the monitoring program.

Environmental Monitoring Program 1.0

The Development Monitoring Program was discontinued in March 1982 and replaced with an Interim Monitoring Program during a period of reduced site activity at the C-3 tract. Each section will specify changes made to the monitoring program.

1.1 Tract Photography

Surface and aerial photography programs were discontinued during the interim monitoring period. They will be reinitiated when Tract activities start up.

1.2 Hydrology and Water Quality

To assist in interpretation of hydrologic and water quality data, the reader must understand that two items in particular may affect monitoring program results: intentional flooding of the V/E shaft and water management practices. The V/E shaft was allowed to flood in September 1981; water levels have reached the equilibrium level shown in Figure 1.2.1.6-1. Direct discharge from Ponds A/B into Piceance Creek via Little Gardenhire Gulch was utilized to dispose of excess mine water from the Production and Service Shafts.

Hydrologic and water quality monitoring frequency and laboratory analysis requirements vary by type and location of sample collection station. The requirements from government agencies also vary regarding purpose of monitoring. Tract C-b monitoring requirements have been detailed in these documents as follows:

- IMP - Interim Monitoring Program prepared for the Oil Shale Office (OSO).
- WAP - Water Augmentation Plan prepared for the State of Colorado Water Court, Division 5.
- NPDES - National Pollutant Discharge Elimination System monthly report prepared for the State of Colorado Water Quality Control Division.

Data reported consists of waters sampled during January through May 1983; these data are presented in tabular and plot form. Levels and Flows Section 1.2.1 contains flows, levels and field measurements of temperature, pH and specific conductance within each sub-section. Table 1.2-1 contains water monitoring requirements by station designation for sample frequencies of levels or flows and water quality. This table replaced Exhibit B, which displayed monitoring requirement for the WAP during development on C-b Tract. Within each sub-section of Water Quality Section 1.2.2, the required frequency is explained and parameters listed for analyses during the Interim Monitoring Program (IMP). Table 1.2-2 is an index of deep wells sampled in and around C-b Tract with lists of page numbers locating levels data, time series plots of levels and water quality for each well by aquifer or zone and location.

Exhibit A (map) presented in jacket Figure 1.2-1 provides location of off-tract sampling sites. Maps are included in each water type sub-section for locating on or near Tract sampling sites. Station coordinates and four-digit computer codes for collection stations sampled periodically since baseline are presented in Section 3.0, Data Automation.

Water quality files in the RAMIS data base system, are continuing extensive quality assurance review with updates being made to erroneous values, data stored under wrong location code, and field data that was not input to these files. This procedure is a means of assuring all data stored

in RAMIS files are correct to the best of our knowledge. Corrected data tables and new statistics (maximum, minimum, mean and standard deviation values) of the water analysis suite will be presented in the next data analysis report, January 1984.

Geothermal Surveys, Inc. (GSI), South Pasadena, California, performed downhole temperature logging of coreholes 21X-12, 22X1 and 43X2 on April 14 and 15, 1983. A report containing the results of each corehole and recommendations for monitoring is presented at the end of this Hydrology volume in Special Reports Section 1.2.4. These wells were recompleted this summer (1983); documentation and monitoring frequencies will be reported at a later date.

1.2.1 Levels and Flows

Hydrologic flows of surface streams, springs and seeps, and water levels in alluvial wells, bedrock wells and impoundments are reported in the sub-sections which follow. Documents and/or permits (IMP, WAP, and NPDES) that require monitoring of these water types are identified within each sub-section.

Tabulated data and time series plots of all water locations follow in respective sub-sections.

**SURFACE
STREAMS**

1.2.1.1 Surface Streams

Daily mean discharge data for eight major surface water gauging stations monitored for the Interim Monitoring Program (IMP) are included in this section. Location of these monitoring stations are shown on Figure 1.2.1.1-1. Data presented cover 1983 water year, October 1982 through April 1983. The following table lists stations and the pages summarizing data.

TABLE 1.2.1.1-1

1.2.1.2 Springs and Seeps

Flow and field measurement data were sampled at 22 springs and 1 seep during January through May 1983 and are presented in this section in tabular and plot form. Monitoring of these springs are required by the Interim Monitoring Program (IMP) and the Water Augmentation Plan (WAP); see Table 1.2-1. The IMP sampling requirements include flows and field measurements (temperature, pH and conductivity) taken monthly at four springs (WS04, WS06, WS07, and WS12) and remaining springs, WS01, WS02, WS03, WS08, WS09, WS10, WS66, and seep WS11 if not diverted for seasonal irrigation; refer to Figure 1.2.1.2-1 for location. Nine springs located around the outer boundaries of C-b Tract can be referenced on Figure 1.2-1 (jacket map). These nine springs are monitored by the State of Colorado Division of Water Resources.

Tables 1.2.1.2-1 through 1.2.1.2-3 consist of data sampled during this report period for C-b Tract springs of flow and field measurements and flow of off-tract springs.

Time series plots of flow data from 28 springs and 1 seep are presented to display a historical picture of spring flow activities since 1979 through May 1983. See Table 1.2.1.2-4 for the page number of each spring plot.

Table 1.2-1 lists water stations and sampling schedule during the interim period.

1.2.1.3 Alluvial Wells

Alluvial wells are located on and near C-b Tract; these wells are shown in Figure 1.2.1.3-1

Monitoring of alluvial wells was begun during the baseline period and has continued through C-b Tract's Developmental Monitoring Program, which ended March 1982. Approval of the Interim Monitoring Program (IMP) was granted by the Deputy Minerals Manager for Oil Shale for the period, April 1983 through April 1984.

Data reported in this section are for the Interim Monitoring Program (IMP).

Water levels and field measurements were sampled monthly for all alluvials except dry holes during the DMP. Water levels sampling frequency remains unchanged during the IMP. Field measurements (temperature, pH and conductivity) are to be sampled semiannually unless a maximum or minimum greater than 20% deviation from baseline values occurs for pH or conductivity; then an additional water quality sample must be taken and analyzed. See Table 1.2-1 for station list and associated sampling frequency.

Table 1.2.1.3-1 presents water level and field measurement data for January 1983 through May 1983 for all alluvial wells.

Time series plots of alluvial well levels are presented in this section; for reference see Table 1.2.1.3-2.

Stevens Recorder instrumentation for monitoring continuous water levels were operating at ten alluvial wells during the Development Monitoring Program (DMP), hence these recorders were removed upon approval of the Deputy Minerals Manager for Oil Shale for the Interim Monitoring Program (IMP).

WATER LEVEL PLOTS IN ALLUVIAL WELLS

LOC-WASS

**BEDROCK
WELLS**

1.2.1.4 Bedrock Wells

This section contains well water elevation readings sampled below the alluvium formation. Data are presented in tabular format for sample period January 1983 through May 1983 and time series plots for 1979 through May 1983. Monitoring of these wells are a requirement of the Interim Monitoring Program (IMP) and the Water Augmentation Plan (WAP), State of Colorado Court, Division 5.

Deep well monitoring network on C-b Tract is presented in 2 figures in this section; Figures 1.2.1.4-1 and 1.2.1.4-2. Well computer codes on these figures are defined as such:

Uinta formation	- WC\$\$
Upper Parachute Creek 1 (UPC ₁)	- WD\$\$
Upper Parachute Creek 2 (UPC ₂)	- WE\$\$
Lower Parachute Creek 3 (LPC ₃)	- WG\$\$
Lower Parachute Creek 4 (LPC ₄)	- WH\$\$
Upper Aquifer Zone	- WX\$\$
Lower Aquifer Zone	- WY\$\$

Sampling frequencies for these wells vary by type, location (in respect to Tract) and purpose of monitoring. Table 1.2-1 references formation of recompletion and sampling requirements for each well. This table replaced Exhibit B, which displayed monitoring requirements for the WAP during development on C-b Tract.

Tables and figures of data reported in this section are presented in the following list:

1.2.1.5 Impoundments/Land Application/Reinjection/ Discharge

Discharging of mine water into Piceance Creek began in July 1982. Water samples for flow and quality analyses were taken at ponds A/B discharge point. Fluoride samples were taken in the field at A/B discharge point (WN40), above discharge point on Piceance Creek (WN41), below discharge point on Piceance Creek (WN42), and at Hunter Creek (USGS Station 061) (WU02). Refer to Table 1.2.1.5-1 for flow and field measurements. Water analyses are reported in Section 1.2.2.5.

Monthly levels samples were taken at 22X-17 (WI19) and 24X-17 (WI17) during January through May 1983. Data are presented in Table 1.2.1.5-2. These wells are designated as injection wells but have never been utilized as such. Plots of these wells for levels follow the data table in Figures 1.2.1.5-1 and 1.2.1.5-2.

Weekly levels readings were taken at pond seepage wells 41X13 (WW13) and 31X12 (WW22) while monthly levels samples were taken at the shale pile seepage well 32Y12 (WW32) during January through May 1983; see Table 1.2.1.5-3. Plots of the pond seepage wells are reported in Bedrock Well Section 1.2.1.4. Refer to Table 1.2.1.4-14 in that section for the corresponding page number. These wells are monitoring water levels in the UPC₁ zone and are reviewed monthly to detect any changes.

Location of water stations presented in this sub-section can be referenced on Figure 1.2-1 (jacket map).

**SHAFT AND
MINE WATER**

1.2.1.6 Shaft and Mine Water

Water levels readings are continuing to be taken weekly since flooding the V/E shaft in September 1981. Data for June through December 1982 are included in this section along with a Plot of water elevation in the shaft since recovery. See Table 1.2.1.6-1 and Figure 1.2.1.6-1.

A water usage report is submitted to the State Engineer's Office monthly. This report consists of all water used and pumped on the C-b Tract. Table 1.2.1.6-2 reports these waters in gallons coming from the various wells, ponds and shafts.

SHALE DUMP

1.2.1.7 Shale Dumps

Leachate data were collected from the lysimeters for May 1983. The leachates are initiated from precipitation percolating (leaching) through the raw shale to the collectors. Collector bottles are designated A thru E. Test set up was described in 1981 C.B. Annual Report.

Field measurement (pH, DO, conductivity and temperature) data are also collected at the lysimeters at three depths. Chemical analyses are analyzed and reported by Colorado State University.

1.2.1.8 Supplemental Water Data - Hydrology

Daily flow readings from Willow and Hunter Creeks for water year 1983 (October 1982 - March 1983) are reported in Tables 1.2.1.8-1 and 1.2.1.8-4 respectively.

Water levels data from five Mobil Oil Company monitoring wells are included in this section for June 1981 through May 1983. Tabulated data can be referenced in Table 1.2.1.8-5. Time series plots follow this data table for Wells MW01 (Well No. 1), MW02 (Well No. 2), MW03 (Well No. 3), MW12 (Well No. 12), and MW13 (Well No. 13), consecutively.

Data reported in this supplemental section are required by WAP.

WATER QUALITY

1.2.2 Water Quality

Water samples taken at USGS surface streams, springs and seeps, alluvial and bedrock wells, seepage wells, discharge points, shafts and shale dumps, were analyzed for various variables depending on the monitoring and reporting requirements of these water stations. Requirements for the Interim Monitoring Plan (IMP), the Water Augmentation Plan (WAP), and the National Pollutant Discharge Elimination System (NPDES) documents are identified within each subsection. Data tables are presented in these subsections for water samples taken in January through May 1983.

STAL

1.2.2.1 Surface Streams

Water samples were collected from 8 USGS stream gaging stations along Piceance Creek. Refer to Figure 1.2.1.1-1 in Surface Streams subsection of the Levels and Flows Section 1.2.1 for station locations. Field data reported in this section are for 1982 water year (October 1981 - September 1982). Field data for 1983 water year will not be in the WATSTOR data base until Spring 1984. Data will be reported in the July 15, 1984 Environmental Monitoring Report. Lab analyses for water samples of 1983 water year (October 1982 - May 1983) are included in this section. Table 1.2.2.1-1 describes parameters sampled with corresponding page number of data tables for 12 gaging stations. Only 8 of these are required during the Interim Monitoring Program; 007, 022, 036, 039, 042, 052, 058 and 061.

Remark codes used in the data tables are defined in Table 1.2.2.1-2.

Remark Codes for USGS
Water Quality Data

<u>CHARACTER</u>	<u>REMARK</u>
E	Estimated Value
<	Actual value is known to be less than value shown
>	Actual value is known to be greater than value shown
M	Presence of material verified but not quantified
N	Presumptive evidence of presence of material
ND	Material specifically analyzed for but not detected
K	Results based on colony count outside the acceptable range (non-ideal colony count)

1.2.2.2 Spring and Seeps

Locations of springs and seeps on and around the C-b Tract are shown in Figure 1.2.1.2-1 of Section 1.2.1.2.

Water quality samples were not taken during this report period (January through May 1983).

During this report period water samples of pH or conductivity remained between the 20% range for these baseline values. If a sample should have been taken, parameters were to be analyzed as followed by the DMP quarterly schedule, Table 1.2.2.2-1.

TABLE 1.2.2.2-1

Parameters Analyzed During IMP - Springs

Ag	Mo	Ca	TDS
AS	Cl	Mg	SO ₄
Ba	Li	Fluoride	CO ₃
Cd	Al	B	HCO ₃
Cr	Sr	Ni	NO ₃

BEDROCK
WELLS

1.2.2.4 Bedrock Wells

During the Interim Monitoring Program water quality samples are taken quarterly or semiannually, depending on the well, for the following parameters.

TABLE 1.2.2.4-1

Parameters Analyzed During IMP

Field Measurements: pH, temperature, dissolved oxygen, conductivity.

As	Pb	K	Ba
Mo	Ca	HCO ₃	CO ₃
Cr	Cl	Mg	SO ₄
Cu	Li	Fluoride	TDS
Fe	Al	B	Oil and Grease
Hg	Sr	BOC	SiO ₂
Mn	Se	Phenols	Cn
Radiology	Zn	Ammonia	Total phosphate
Na	COD	Hardness	
Br	Alkalinity	NO ₃	

Field measurements for pH, temperature, specific conductance and field fluoride were taken at WD90 (SG-10) in February and May 1983. See Table 1.2.2.4-2.

Samples were taken in February and April 1983 at WX44 (AT-1C-3). The Bar-Cad sampler was found to be malfunctioning in April, therefore that sample should be classified as an outlier. Analysis is to be done on 1982 and 1983 samples to check for other outliers resulting from the malfunction.

An unscheduled sample was taken in February 1983 at WX32 (32X12) and analyzed for mercury (mg/l). See Tables 1.2.2.4-3 and 1.2.2.4-4 for field and lab analyses of these two upper aquifer wells. A sample was taken in February 1983 of lower aquifer well WY45 (AT-1C-1). Refer to Tables 1.2.2.4-5 and 1.2.2.4-6 consecutively.

IMPOUNDMENTS/
LAND APPLICATION/
REINJECTION/DISCHARGE

1.2.2.5 Impoundments/Land Application/Reinjection/ Discharge

Water samples were taken at A/B discharge point (WN40), on weekly, monthly and quarterly intervals during January through May 1983. Weekly and monthly sampling frequencies are a requirement of our NPDES discharge permit. Data tables of these samples are reported in Table 1.2.2.5-1 and 1.2.2.5-2.

During the interim period, quarterly water samples for field and lab analyses are required by the Oil Shale Office. These samples vary slightly from semiannual samples required during C-b Tract's development phase. Parameters analyzed are total alkalinity, Al, ammonia, As, Ba, HCO_3 , CO_3 , BR, hardness, Na, Mg, Ca, Mo, NO_3 , oil and grease, phenols, K, B, total dissolved solids, Sr, SO_4 , Cl, COD, Cr, Cu, SiO_2 , cyanide, Hg, Se, Ag, Zn, Pb, Li, Mn, Fe, F, DOC, suspended solids, Co and V. Results of two scheduled samples taken in January and April 1983 are reported in Table 1.2.2.5-3. Field samples of pH, specific conductance, and temperature were taken when water samples were collected for quarterly analyses. See Table 1.2.2.5-4.

Monthly field samples were taken at Ponds A/B and C seepage monitoring wells (WW13 and WW22) in January through May 1983 while a semiannual field sample was collected in May 1983 at the leachate shale pile monitoring well (WW32). See data Table 1.2.2.5-5.

A semiannual water sample was collected at the two pond seepage monitoring wells and were analyzed for the same parameters listed above, excluding DOC, suspended solids, Co and V. Field and lab analyses results are reported in Tables 1.2.2.5-6 and 1.2.2.5-7.

WATER QUALITY
ASSURANCE

1.2.4 Water Quality Assurance

Complying with the water monitoring Quality Assurance Program implemented in 1981, an extensive review of all water lab analyses stored in the RAMIS data base water quality files are continuing to be checked for incorrect values entered. Data screening is a method for detecting errors occurring from field sampling through data handling and reporting. Corrected data tables will be presented in the January 1984 Environmental Monitoring Report.

Fluoride analyses are being conducted at the C-b Tract field lab and later at the Grand Junction lab for A/B discharge samples taken weekly. See Table 1.2.4-1. The instrumentation utilized is different in electronic sensitivity, therefore analysis conducted at C-b Tract field lab may not be as accurate as the Grand Junction lab. Field fluoride analysis does aid us in detecting high fluoride concentrations being discharged into Little Gardenhire via Piceance Creek.

Other aspects of the water quality assurance program for sampling methodology and logging, field tests, analytical methods and quality control in the laboratory, data record keeping and inspection, and outlier detection are ongoing procedures to assure that the end results of our data sampling are correct to the best of our knowledge.

The procedures formulated in the Quality Assurance Program for Hydrology are designed to comply with monitoring and analytical practices approved by the Environmental Protection Agency, the United States Geological Survey and other appropriate groups.

In conjunction with implementation of the Quality Assurance Program, the Cathedral Bluffs' Environmental Services Department carries out routine assessment inspections of the field sites to evaluate the operation of the program. These inspections have been helpful in maintaining full compliance with the quality assurance procedures, making necessary adjustments to the program, and introducing alterations suggested by the experience of the field monitoring personnel.

Introduction

On April 14 and 15, 1983, G. Pavlov of Geothermal Surveys, Inc., South Pasadena, California, performed downhole temperature logging of coreholes 21X-12, 22X-1 and 43X-2 (Figure 1). The purpose was to aid determination of the final scheme for completion of these coreholes as ground water monitors.

Method

The method of temperature logging used for the present survey is described in GSI report, Preliminary Interpretation of Thermal Gradient Logging, July 1982. In comparison with the temperature logging of the same corehole during 1981, the intervals between the readings were changed from 20 to 10 ft. This provided more details of the temperature distribution in the vicinity of the wells.

The basis for interpretation of the results is that the temperature characteristics of the geologic formations are different depending on their structure, texture, composition, content of the moisture, and ground water movement. These differences may be revealed by departures of the measured temperature gradient from the average Earth temperature gradient.

Results

The temperature patterns measured in the coreholes quite closely repeat the results obtained with the survey performed during October of 1981. There are some observed differences between the results of both surveys, and these suggest some changes in the ground water regime between 1981 and 1983. The changes might be caused by Reinjection, by the flooding of the V/E Shaft, or both.

Detailed interpretation of the temperature logs of the coreholes are provided in the Appendix of this report.

TRACT C-b

RIO BLANCO COUNTY, COLORADO

Corehole 21X-12

Figure 2 presents the temperature curves of surveys both in 1981 and 1983. The temperatures in the second survey are about 0.05 to 0.3°C higher than in the first survey. The differences in the upper part of the curve are greater than in the lower part.

Three major zones could be separated according to the values of the temperature gradient. The uppermost zone reaches down to about 450 ft and has a temperature gradient of 0.9°C per hundred feet. Two aquifers are indicated on the temperature curve at intervals 360-380 ft and 440-460 ft. Descending crossflow between the aquifers can explain the vertical gradient. The flat portion of the temperature curve indicates higher water temperature in the lower of the two aquifers.

A second zone extends from 450 ft to about 750 ft depth with a temperature gradient of 0.3°C per hundred feet. It shows alternating zones of greater and lesser ground water flow indicating thin aquifer zones of about 10 ft to 20 ft, separated by 10 ft to 20 ft zones of little flow.

The temperature curve of the third zone, extending from 750 to 1500 ft, is close to vertical and shows several minor aquifers.

Corehole 22X-1

Figure 3 presents the results of the temperature logs performed during 1981 and 1983. The differences of the overall temperature gradient differentiates the profile into three major zones. The uppermost zone extends from 300 to about 800 ft depth with temperature gradient 0.52°C per hundred feet. More active aquifer with slightly higher temperature of the ground water, is indicated by the temperature curve at 390-450 ft. The rest of this interval has some minor aquifers.

A second zone extends from 800 ft to about 1100 ft in depth and has temperature gradient 0.43°C per hundred feet. Aquifer activity is indicated in most of this zone. The temperature of the ground water increases more than 0.5°C in the interval 800-850 ft. The temperature of the second survey is about 0.3°C lower than in the first.

The lowest zone, from 1100 ft to 1400 ft, has a slightly higher temperature aquifer, as indicated by flattening of the temperature curve between the Four Senators and A-Groove at 1100-1180 ft depth. Below 1180 ft, the steep gradient shows moderate higher temperature water flow.

TEMPERATURE LOG

COREHOLE 22 X-1

EL. 6704'

TRACT C-b

RIO BLANCO COUNTY, COLORADO

Corehole 43X-2

Figure 4 presents the results of the temperature logging of Corehole 43X-2. The overall temperature gradient is 0.5°C per hundred feet. In the zones with higher aquifer activity, the second logging shows in general lower temperatures suggesting some change in the ground water flow.

Zones with active ground water movement are indicated at depths 320-490 ft, 460-590 ft, 670-810 ft, 820-970 ft and 980-1040 ft. The steep temperature gradient in the Mahogany Zone could be caused by the crossflow between minor aquifers.

Discussion

Figure 5 presents the results of the temperature downhole logging performed in April 1983. This plot permits more convenient comparison of the differences of the temperatures in the coreholes.

Coreholes 22X-1 and 43X-2 exhibit close overall temperature gradient. The departure of the temperature in Corehole 21X-12 below 600 ft might depend on several reasons:

- significant amount of gas invading the corehole;
- communication among aquifers between 600 ft and 1300 ft;
- changes in ground water flow due to the mining operations in the vicinity of Corehole 21X-12.

Several temperature anomalies can be correlated in the several coreholes. At about 430 ft, Coreholes 21X-12 and 43X-2 have high temperature gradients which might be caused by inflow of higher temperature water. Similar behavior is observed in Corehole 22X-1 at 380 ft depth. In the interval 430-600 ft, the temperature characteristics of the formation in all three coreholes are comparatively similar.

Some higher temperature water inflow may be taking place at about 800 ft depth in Coreholes 22X-1 and 43X-2. Another similar zone may be delineated at 950 ft in Corehole 43X-2. The 1981 temperature log of Corehole 22X-1, shows a strong positive temperature anomaly with the same characteristic at about 1100 ft depth. It is very likely that both anomalies are caused by ground water flow with temperature significantly higher than in the overlying materials.

Table 1 presents zones of ground water activity recommended for monitoring. Aquifer zones to be monitored were based on location relative to the C-b Tract activities and the present status of monitors within the aquifers in other nearby wells. The specific zones within the aquifers to be monitored were based on the interpretation of the thermal logs, other geophysical logs, and other data relating to Tract hydrology.

COREHOLE 21X-12

Interval	Interpretation
320' - 350'	Possible aquifer activity in the upper part of the interval. The lower part probably consists of relatively impermeable material.
350' - 380'	The caliper log indicates looser formation, possible aquifer. The temperature shows transitional character from lower to higher values. This could occur if the temperature of the water in this aquifer is higher than that of the formations above.
380' - 440'	The vertical temperature curve suggests that downflow between the aquifers at depths 380 and 450 ft is taking place. The formations do not vary much in density and do not yield water with different temperature. That suggests aquitard characteristics.
440' - 460'	Dramatic change of the temperature indicates a flow of water with about 0.5°C higher temperature. Density log shows sudden drop in the density of materials which coincides with increase of diameter of the hole. The gamma ray log has a local minimum. Together these factors suggest the presence of formation with good aquifer characteristics.
460' - 580'	No large significant temperature trends are observed. The density log indicates consistent density of the formation at about 1.75 g/cc. Gamma ray log indicates an increase in clay content. Variable but moderate aquifer activity.
580' - 650'	A negative temperature anomaly. The more detailed survey limits the lower end of the anomaly at depth 610 ft. At that depth, slight increase of the hole diameter and decrease in density of the formation is observed. Based on this, an active aquifer can be differentiated, although the gamma ray log indicates an increase in clay content. Downflow movement of the water probably occurs below this interval.
650' - 850'	All geophysical logs exhibit only slight variations. The average temperature gradient becomes steeper which might be an indication of some ground water movement.

850' - 1500' The temperature curve approaches vertical and does not yield much information which could be interpreted confidently.

COREHOLE 22X-1

Interval	Interpretation
300' - 390'	The temperature curve indicates two minor aquifers at 320 ft and 350 ft. SP log shows alternatively high and low anomalies in the interval 320 - 335 ft and low anomaly at 350 ft.
390' - 450'	Possible flow of ground water with slightly higher than surrounding temperatures. The values of SP and gamma ray logs increase below 400 ft.
450' - 650'	No significant aquifer activity is indicated by the geophysical logs.
650' - 780'	The temperature gradient becomes steeper which suggests a slight increase of the aquifer activity.
780' - 870'	The temperature increases rapidly over 0.5°C. Over the interval 800-870 ft, the SP is low and density is high. The gamma ray intensity is relatively low. This could be an indication of decreased content of shale. The low velocity of the fluid movement into the well shows that the transient temperatures in the interval 800-850 ft indicate increased aquifer activity.
870' - 1060'	Moderate aquifer activity. Below 950 ft density increases with frequent low anomalies which seems peculiar for the Parachute Creek Formation. The caliper log shows increase of irregularities below 1010 ft which is related to the Mahogany Zone in all three coreholes. The temperature of the second survey is considerably lower than that of the first.

- 1060' - 1100' Low density with high gamma ray activity and positive SP anomaly characterizes the presence of tuff in the interval 1060-1080 ft. Immediately below these, a very low density anomaly is probably related to a minor aquifer. Very slight variation in the temperature observed in the lower part of the interval is caused probably by minor aquifer activity.
- 1100' - 1200' Transient temperatures and low fluid velocity indicate significant aquifer activity in this interval. The temperature increases about 1.5°C. The positive anomaly in the interval 1140-1180 ft is caused by formation with lower permeability, confirmed by positive SP anomaly.
- 1200' - 1400' No significant anomalies in the temperature field were observed. Moderate aquifer activity with higher temperature of the ground water.

COREHOLE 43X-2

Interval	Interpretation
290' - 320'	Steep temperature gradient indicates some ground water activity.
320' - 360'	The size of borehole increases. Density of the formation becomes lower. The transient temperature could be caused by inflow of water with higher temperature.
360' - 430'	Density of the formation slightly increases. Some aquifer activity.
430' - 460'	Transitional zone caused by materials with low permeability.
460' - 580'	Steep temperature gradient, indicating aquifer activity.

- 580' - 620' Close to normal temperature gradient. Moderate aquifer activity.
- 670' - 800' Increased borehole diameter. Steep temperature gradient. Significant ground water activity.
- 800' - 840' Slightly higher than normal temperature gradient. Increased density of the formation. Smaller borehole diameter. Very little ground water activity.
- 840' - 970' Steep temperature gradient. Active aquifer.
- 970' - 1030' The higher temperature of the second logging is a possible indication of inflow of water with higher temperature.
- 1030' - 1380' The steep temperature gradient in the Mahogany Zone may be caused by local aquifers. These are indicated by SP and caliper anomalies at 1010-1020, 1030-1040, 1070-1080, 1115-1125, 1170, 1200 and 1320 ft.
- 1380' - 1500' Temperature gradient is higher than normal. This is probably a transition zone from the anomalous lower temperature of the previous interval to a normal temperature.
